

Creating Rollover Buttons Using Fireworks & Dreamweaver

Using Fireworks: Create two buttons using the Fireworks button tutorial. Save buttons to your project folder. One button will be the 'up' state of the button- the static button image. The other will be the rollover state of the button- how the image will look when the user mouses over the button. This can be a simple glow or shadow on the text, or perhaps the background color of the button changes. Or, maybe a hidden message!

Using Dreamweaver: Create a new document and save to your project folder. Insert your first button image. If you are linking the button to a page, you can type the link in the Properties window.

Open the Behaviors Window Window > Behaviors

While the button image is selected, go to the Behaviors menu, click "+" and choose "Swap Image".

Click "Browse" and select your second image. Keep the check boxes below checked. Click "OK"

Save your webpage and go to **File > Preview in Browser** to test out your button.

***Hint:** Rollovers don't need to only apply to buttons.*
